

SOP: Split Echelon/PRIMAL Logo Links on Primal Strength US

Author: Prepared for Primal Strength US engineering team

Version: 1.0.0

Related implementation: Mirrors the split-logo pattern originally shipped on echelonfit.com ([sections/mega-menu.liquid](#), v1.0.0), adapted for the Primal Strength US theme.

Objective

The Primal Strength US header displays a single combined SVG logo containing both the "echelon" wordmark and the "PRIMAL" wordmark, separated by a vertical divider bar. This procedure makes each half independently clickable without altering the visual logo itself:

- Clicking the **echelon** portion opens <https://echelonfit.com/>
- Clicking the **PRIMAL** portion opens the Primal Strength US homepage ([routes.root_url](#))

This is the mirror image of the Echelon implementation, where the Echelon portion linked home and the PRIMAL portion linked out to us.primalstrength.com.

Current result

The header logo is rendered as an inline SVG (not a raster image) via the [logo_svg](#) setting on the [header](#) section, sourced from [sections/header-group.json](#). Two transparent anchor regions are layered on top of the SVG, sized by percentage to match the divider's real pixel position within the SVG's [viewBox](#).

Files and theme

- **Source file:** [sections/header.liquid](#)
- **Store:** primal-strength-us.myshopify.com
- **Production theme:** [primal-strength-us/ux-project](#), theme ID 142304510051
- **Header section instance:** Header & Navigation, Header Menu setting UX Project Menu (handle ux-project-menu)
- **Logo source data:** [sections/header-group.json](#) → [sections.header.settings.logo_svg](#) (this is the field that actually renders; the

`logo_svg` value visible in the theme editor's **Header & Navigation** panel is the same field)

Before editing

Confirm the intended store is `primal-strength-us.myshopify.com` and the theme ID above is still the **Live/Published** theme (Admin → Online Store → Themes). If a different theme is published, get its ID before proceeding — do not assume the ID above is still current.

Duplicate the live theme first and validate on the copy before touching production, exactly as done for the Echelon rollout.

Implementation summary

Unlike Echelon's `mega-menu.liquid` (which duplicates the logo markup three times — desktop, mobile top-bar, mobile drawer), this theme renders the header logo **once** in `header.liquid`, and CSS/JS handles the mobile/desktop responsive sizing. Only one code location needs to change.

The original markup was a single `<a class="header-logo" href="{{ routes.root_url }}">` wrapping either an image, this inline SVG, or a text fallback, depending on which setting is populated.

The fix branches on `section.settings.logo_svg != blank`:

- **When the combined SVG is present** (the current live case): render a `<div class="header-logo header-logo--brand-split">` containing the SVG plus two transparent, absolutely positioned anchors — no outer `<a>`, since nested anchors are invalid.
- **When it is not present** (image or text fallback): keep the original single `<a class="header-logo">` wrapper exactly as before, unchanged.

This preserves all non-SVG behavior exactly as-is and limits the new split-link behavior strictly to the combined-logo case.

Divider position (why 49.7% / 50.3%)

The split percentages were **not eyeballed** — they were computed from the actual SVG path data. The combined logo's `viewBox` is `0 0 3062 392`. Parsing the path's subpaths and isolating the tallest, narrowest one (the vertical divider bar) gives a bounding box of `x: 1509.0` to `x: 1534.0`, i.e. a divider centered at `x = 1521.5`.

None

```
left (echelon) width  = 1521.5 / 3062 = 49.7%  
right (PRIMAL) width  = (3062 - 1521.5) / 3062 = 50.3%
```

This was verified visually by rendering the SVG and drawing a line at the 49.7% mark — it lands exactly on the divider bar.

If the logo asset is ever redrawn (new divider position, different word lengths, etc.), these two percentages must be recalculated the same way — do not assume they still apply.

Why `!important` is required

Unlike the Echelon rollout (where no `!important` was needed), this theme's external `header.css` stylesheet was found — through direct DOM inspection in production — to be resetting the split anchors' positioning, collapsing them to `0x0` even though the CSS rules were present and loaded. The exact conflicting selector inside `header.css` was not identified (that file is a compiled/external asset, not part of this section), but the symptom was conclusive: `getBoundingClientRect()` on the split anchors returned `width: 0, height: 0` in production while the parent wrapper measured correctly at `200x25.6px`.

All positioning-critical declarations (`position`, `top`, `bottom`, `left/right`, `width`, `display`, `pointer-events`, `z-index`) are therefore marked `!important` in the final implementation. **Do not remove these `!important` flags** without first re-running the diagnostic in the Testing section below to confirm the external stylesheet conflict is no longer present.

Transparent-header consideration

The header uses the theme's `transparent-header` class, a common pattern where the header floats over hero content and disables pointer events on most of the header except specific known-safe elements. `pointer-events: auto !important` is applied to the wrapper and both split anchors for this reason, independent of the positioning fix above. Both issues were present simultaneously in this rollout; do not assume fixing one makes the other unnecessary.

Draft-theme test

Duplicate the live theme in Admin → Online Store → Themes → ... → Duplicate. Push only the section file to the duplicate:

Shell

```
shopify theme push \
```

```
--store primal-strength-us.myshopify.com \  
--theme <DRAFT_THEME_ID> \  
--only sections/header.liquid
```

Open the preview:

```
None  
https://us.primalstrength.com/?preview\_theme\_id=<DRAFT\_THEME\_ID>
```

Confirm:

- The logo still looks like one unchanged combined mark
- Clicking the left ("echelon") half navigates to <https://echelonfit.com/>
- Clicking the right ("PRIMAL") half stays on the Primal Strength US homepage
- Keyboard focus (Tab) shows a visible outline on both link regions
- No other header controls (menu, search, account, cart, localisation selector) are affected

Required console diagnostic before declaring success

Because this exact bug (anchors collapsing to zero size) was silent and only visible via DOM measurement, always confirm in the browser console before sign-off:

```
JavaScript  
const e1 = document.querySelector('.header-logo__brand-link--echelon');  
console.log('Echelon link rect:', e1.getBoundingClientRect());  
const e2 = document.querySelector('.header-logo__brand-link--primal');  
console.log('Primal link rect:', e2.getBoundingClientRect());
```

Both **width** and **height** must be non-zero. If either reads **0**, do not proceed to production — see Troubleshooting below.

Production deployment

Once the draft checks pass:

```
Shell  
shopify theme push \  
  --store primal-strength-us.myshopify.com \  
  --theme 142304510051 \  
  --only sections/header.liquid
```

```
--only sections/header.liquid \  
--allow-live
```

After the push, open <https://us.primalstrength.com/> in a new private browser window (not the theme editor — the Shopify theme customizer intentionally intercepts clicks for section selection and will falsely appear broken) and repeat all checks above, including the console diagnostic.

Troubleshooting

Symptom: click does nothing, no navigation, no visual change.

1. Confirm you are testing on the live storefront URL, not inside Admin → Online Store → Themes → Customize. The theme editor intercepts clicks by design.
2. Run the console diagnostic above. If `width/height` read `0`, the external theme stylesheet is very likely resetting the anchors' `position` back to `static`, and since these anchors are empty (no text content), they collapse to zero size in normal flow. Re-confirm every positioning property in `.header-logo__brand-link` and its two modifiers carries `!important`.
3. If sizes are non-zero but `document.elementFromPoint(x, y)` at the link's center returns a different element (e.g. a hero video, an announcement bar slide), something else is stacked above the link. Raise `z-index` further and confirm `pointer-events: auto` is present on every ancestor up to `.header-logo--brand-split`.
4. Hard-refresh (Ctrl/Cmd+Shift+R) before concluding the fix failed — theme CSS assets are aggressively cached.

Rollback

If any unrelated header behavior changes after deployment, restore the previous `sections/header.liquid` from the pre-deployment theme version and push only that file to the same theme. Do not roll back unrelated theme files.

Change control

Record the date, theme ID, file path, reviewer, and result of the desktop/mobile/console-diagnostic checks in the release notes or pull request.
